Online Supplement

Online Supplement accompanying the final manuscript.

The primary analysis concerns purchased/eligible Freddie Mac mortgages and 90+ day delinquency during the first 24 scheduled-payment months. Risky/non-risky labels are analytical classifications; the primary 5:1 FN:FP loss ratio is illustrative, not measured lender economics. Appendix A numbers relocated displays separately from Tables S1–S10 and Figures S1/S3. All existing scientific quantities, table rows and figure assets are retained.

Appendix A. Supporting Main-Analysis Displays

Appendix Table A1. Cohort design and eligibility.

Official Freddie Mac Standard annual samples contain purchased/eligible mortgages, not applications or all U.S. originations. The unit is one mortgage at origination and the outcome is 90+ day delinquency during the first 24 scheduled-payment months. Month 1 is First Payment Date and month 24 ends 23 calendar months later, no later than the role-specific cutoff. The primary observed-delinquency rule retains observed numeric 03–99 events despite earlier gaps; non-events require complete valid reporting through month 24 or valid Code 01 payoff without an earlier event. Ambiguous exits and unresolved histories are excluded; payoff does not create a counterfactual post-payoff history. Gross, calendar-mature and eligible counts have distinct denominators. Nineteen origination predictors are retained, and predictor missingness alone does not exclude a mortgage.

A. Final temporal roles

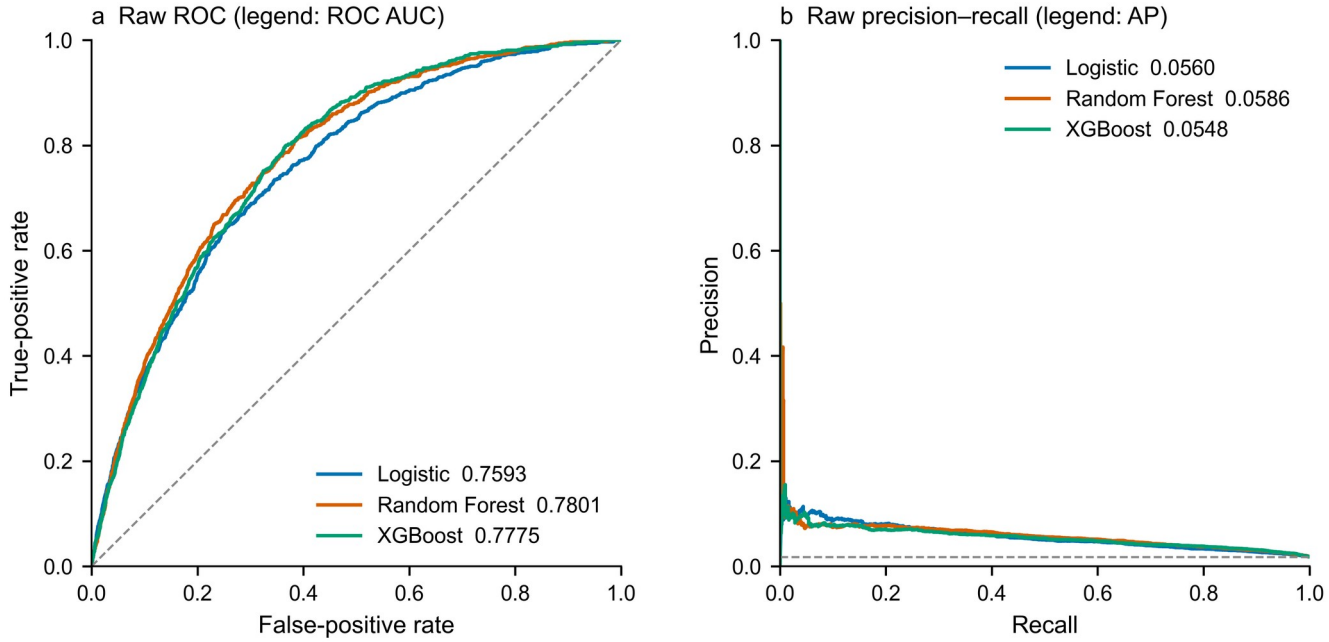
Role	Vintages	Endpoint cutoff	Eligible N	Events	Event (%)
Development	2015–2019	2022-12	239,435	4,550	1.900
Validation	2020	2022-12	45,364	771	1.700
Frozen test	2023	2026-03	49,338	886	1.796

B. Annual source-to-cohort flow

Vintage	Raw N	Calendar- mature N	Eligible N	Events	Event (%)	Excluded N
2015	50,000	50,000	47,221	252	0.534	2,779
2016	50,000	50,000	48,031	330	0.687	1,969
2017	50,000	50,000	48,211	397	0.823	1,789
2018	50,000	49,999	47,393	1,279	2.699	2,607
2019	50,000	49,996	48,579	2,292	4.718	1,421
2020	50,000	45,745	45,364	771	1.700	4,636
2023	50,000	49,964	49,338	886	1.796	662

Appendix Figure A1. Raw-score discrimination in the primary 2023 cohort.

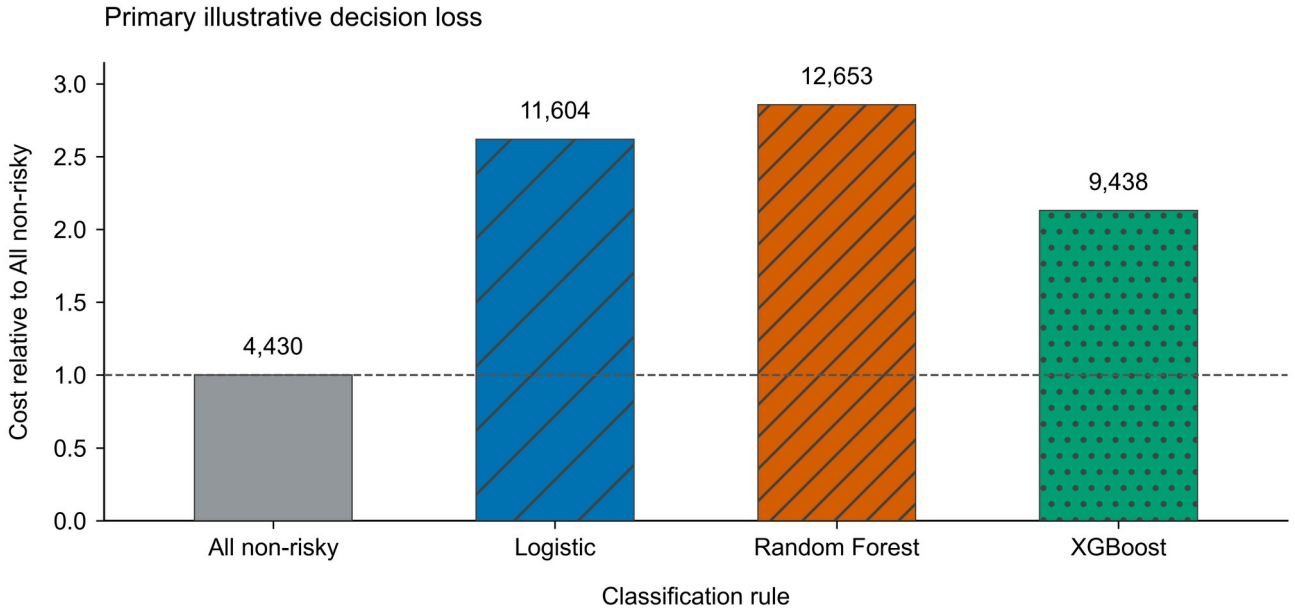
ROC and precision–recall curves compare Logistic Regression, Random Forest and XGBoost for 90+ day delinquency during the first 24 scheduled-payment months among 49,338 purchased/eligible mortgages, including 886 events. Only raw model scores are used for discrimination. The ROC diagonal is a no-discrimination reference; the horizontal precision reference is the observed prevalence of 1.796%. Legend AP values are average precision, not trapezoidal precision–recall area. Axes retain the full unit range. These curves describe ranking performance, not institutional decision value or statistical superiority; no uncertainty bands are shown.



Frozen 2023 purchased/eligible mortgages (N = 49,338; 886 events). Outcome: 90+ day delinquency during the first 24 scheduled-payment months. Raw scores only. AP denotes average precision, not trapezoidal PR area. Dashed lines show the ROC diagonal and PR prevalence baseline (1.796%). No confidence intervals or statistical-superiority claim.

Appendix Figure A2. Primary illustrative decision loss relative to all non-risky.

Frozen historical calibrated probabilities classify 49,338 purchased/eligible mortgages as risky at p ≥ 1/6 for 90+ day delinquency during the first 24 scheduled-payment months (886 events). The illustrative 5:1 FN:FP loss is FP + 5FN. The benchmark classifies all mortgages as non-risky and costs 4,430. Bar heights show cost relative to this same-cohort benchmark, absolute-cost annotations reproduce the reported costs, and the dashed reference is one. XGBoost has the lowest cost among the three model-based rules, but still exceeds the all-non-risky benchmark. Illustrative loss is not measured lender economics; these are analytical risky/non-risky classifications. No raw-probability or validation-optimal rule is included.



Appendix Table A2. Compact robustness summary.

Each row uses its own specification's purchased/eligible cohort and all-non-risky benchmark. Discrimination uses raw ROC AUC. The lowest three-model calibrated common 5:1 cost is taken from the same model row as its benchmark ratio; this is a retrospective descriptive minimum, not test-based model selection. The primary outcome is 90+ day delinquency during the first 24 scheduled-payment months; R2 changes it to the distress composite, R3 conditions on remaining on book, and R7 adds First Payment Date as a timing proxy rather than exact origination month, extrapolating beyond development support. R3 and R7 materially change interpretation. All three primary model-based calibrated common 5:1 rules remain above their own all-non-risky benchmark in the primary analysis and R1–R7, while rankings and model-induced reclassification magnitude are more specification-sensitive. Event and disagreement rates are percentages in the reader table; the 5:1 FN:FP loss ratio is illustrative, not measured lender economics.

Cohort and raw discrimination

Specification	Scientific change	Test N	Event rate	Logistic raw ROC AUC	Random Forest raw ROC AUC	XGBoost raw ROC AUC
S10	Candidate A / T2 reference	49,338	1.796%	0.7593	0.7801	0.7775

Specification	Scientific change	Test N	Event rate	Logistic raw ROC AUC	Random Forest raw ROC AUC	XGBoost raw ROC AUC
R1	Candidate C complete-history 90+ outcome	49,328	1.776%	0.7614	0.7812	0.7801
R2	Candidate B distress-composite outcome	49,338	1.796%	0.7594	0.7816	0.7779
R3	Conditional-on-remaining-on-book cohort	40,514	2.187%	0.7321	0.7354	0.7024
R4	Exclude all within-window Code 96 loans	49,308	1.736%	0.7583	0.7834	0.7724
R5	Exclude unusual First Payment Dates	49,321	1.796%	0.7594	0.7740	0.7752
R6	T1 temporal design	37,022	1.723%	0.7735	0.7960	0.7903
R7	Three time-feature sensitivity	49,338	1.796%	0.7687	0.7463	0.7762

Illustrative common 5:1 loss and model-induced reclassification

Specification	Lowest model cost	Model attaining minimum	Cost / own All non-risky	Logistic–XGBoost disagreement N	Disagreement rate	Interpretation class
S10	9,438	XGBoost	2.130	5,950	12.06%	reference
R1	8,401	XGBoost	1.918	6,966	14.12%	quantitatively changed but same conclusion
R2	7,440	XGBoost	1.679	6,690	13.56%	quantitatively changed but same conclusion
R3	23,145	XGBoost	5.225	11,983	29.58%	materially changes interpretation
R4	8,693	XGBoost	2.031	5,752	11.67%	quantitatively changed but same conclusion
R5	7,685	XGBoost	1.735	6,539	13.26%	quantitatively changed but same conclusion
R6	6,852	XGBoost	2.148	4,734	12.79%	quantitatively changed but same conclusion
R7	6,619	XGBoost	1.494	41,218	83.54%	materially changes interpretation

Interpretation notes

• S10: Frozen Candidate A/T2 reference, not a sensitivity.

• R1: Complete-history event eligibility changes quantitative results; the common calibrated 5:1 loss conclusion remains.

• R2: The distress-composite outcome changes the event definition; the common calibrated 5:1 loss conclusion remains.

• R3: Restriction to remaining on book changes the estimand; raw Logistic discrimination exceeds XGBoost and disagreement rises to 29.58%. This is not post-payoff counterfactual risk.

• R4: Excluding all within-window effective-date Code 96 exits changes the cohort without recoding Code 96; the common calibrated 5:1 loss conclusion remains.

• R5: Excluding unusual First Payment Dates changes the cohort; the common calibrated 5:1 loss conclusion remains.

• R6: T1 changes validation maturity and restricts test to 2023Q2–Q4; discrimination differs, while the common calibrated 5:1 loss conclusion remains.

• R7: First Payment Date timing-proxy features alter rankings and yield 83.54% disagreement. Out-of-support timing is consistent with extrapolation sensitivity, not proof of a causal mechanism.

S.A Reproducible features and training

Table S1. Predictors, preprocessing and frozen grids

The primary models share exactly 19 origination predictors (seven numeric and twelve categorical). Predictor definitions, exclusions, full hyperparameter grids and selected settings are reported below. Medians, missingness indicators and category handling are learned only within the earlier-year fit subset; Logistic Regression additionally standardizes numeric inputs. Four chronological folds select models by mean log loss. No class weighting or resampling is used. Historical isotonic calibration uses training-period forward out-of-fold predictions; FT-Transformer remains exploratory, not a fourth primary benchmark.

Primary predictor definitions

Column panel 1 of 2 — Primary predictor definitions

feature_name	source_field	conceptual_group	clean_type	missing_rule	allowed_values_or_range	primary_predictor
classic_fico	Classic FICO	borrower	integer_nullable	9999 or blank -> null; out-of-range -> null plus diagnostic	300-850	yes
original_dti	Original Debt-to-Income Ratio	borrower	integer_nullable	999 or blank -> null; out-of-range -> null plus diagnostic	0-65	yes
first_time_homebuyer	First Time Homebuyer Indicator	borrower	categorical	9 or blank -> unknown	yes; no; unknown	yes
borrower_structure	Number of Borrowers	borrower	categorical	99 or blank -> unknown; invalid -> unknown plus diagnostic	one; multiple; unknown	yes
original_upb	Original UPB	loan	integer_nullable	blank/nonpositive/invalid -> null plus diagnostic	>0; rounded to nearest $1,000	yes
original_ltv	Original Loan-to-Value	loan	integer_nullable	999 or blank -> null; outside vintage-specific range -> null plus diagnostic	6-105 through 2018Q1; 1-998 from 2018Q2	yes
original_cltv	Original Combined Loan-to-Value	loan	integer_nullable	999 or blank -> null; outside vintage-specific range -> null plus diagnostic	6-200 through 2018Q1; 1-998 from 2018Q2	yes
original_interest_rate	Original Interest Rate	loan	float_nullable	blank, nonnumeric, or negative -> null plus diagnostic	>=0; no finite maximum documented	yes
original_loan_term	Original Loan Term	loan	integer_nullable	blank, nonnumeric, or nonpositive -> null plus diagnostic	>0 months; calculated from maturity and first payment dates	yes
loan_purpose	Loan Purpose	loan	categorical	9 or blank -> unknown; other invalid -> unknown plus diagnostic	purchase; cash_out_refinance; no_cash_out_refinance; refinance_not_specified; unknown	yes
channel	Channel	loan	categorical	9 or blank -> unknown; other invalid -> unknown plus diagnostic	retail; broker; correspondent; third_party_not_specified; unknown	yes
super_conforming_flag	Super Conforming Flag	loan	categorical	blank -> unknown; invalid -> unknown plus diagnostic	yes; no; unknown	yes
harp_indicator	HARP Indicator	loan	categorical	blank -> unknown; invalid -> unknown plus diagnostic	yes; no; unknown	yes
special_eligibility_program	Special Eligibility Program	loan	categorical	blank -> not_available_or_not_applicable; invalid nonblank -> unknown	home_possible; hfa_advantage; refi_possible; not_available_or_not_applicable; unknown	yes
occupancy_status	Occupancy Status	property	categorical	9 or blank -> unknown; invalid -> unknown plus diagnostic	primary_residence; investment_property; second_home; unknown	yes
property_type	Property Type	property	categorical	99 or blank -> unknown; invalid -> unknown plus diagnostic	cooperative; condominium; planned_unit_development; single_family; manufactured_housing; unknown	yes
number_of_units	Number of Units	property	categorical	99 or blank -> unknown; invalid -> unknown plus diagnostic	one; two; three; four; unknown	yes
property_state	Property State	geography	categorical	blank/invalid -> unknown plus diagnostic	two-letter state or territory code; unknown	yes
msa_or_division	MSA or Metropolitan Division	geography	categorical	blank -> nonmetropolitan_or_unknown; invalid nonblank -> unknown	five-digit MSA/division; nonmetropolitan_or_unknown; unknown	yes

Preprocessing and information exclusions

record_type	parameter	setting
preprocessing	numeric_cast	Decode frozen sentinels; numeric blanks/unparseable values become missing.
preprocessing	numeric_imputation	Median fitted in each earlier-year fit subset; no validation/test information.
preprocessing	numeric_missing_indicators	SimpleImputer(add_indicator=True); indicators for columns missing during fitting.
preprocessing	categorical_missing	Blank/null becomes __missing__; documented explicit unknown/unavailable levels retained.
preprocessing	categorical_protected_levels	unknown, nonmetropolitan_or_unknown, not_available_or_not_applicable and __missing__ are protected from rare pooling when observed during fitting.
preprocessing	categorical_rare_unseen	Fit-subset category counts; below min_frequency and later unseen values map to __rare_or_unseen__; one-hot, no ordinal assumptions.
preprocessing	numeric_scaling	Logistic standardizes the imputed numeric block and indicators using fit-subset parameters; RF/XGBoost do not scale.
preprocessing	fold_preprocessing	Preprocessing is refitted independently within every forward fold.

record_type	parameter	setting
preprocessing	weighting_resampling	No class weights, SMOTE, oversampling or undersampling.
preprocessing	selection	Unweighted four-forward-fold mean log loss; fixed 0.0001 effective-tie tolerance and frozen family-specific simplicity preference.
preprocessing	probability_calibration	Historical isotonic mapping fitted to pooled 2016–2019 forward OOF scores only; mappings locked before 2020/2023.
preprocessing	excluded_information	Loan ID, outcome, vintage, First Payment Date and performance/audit fields excluded; remaining exclusions follow frozen feature definitions.

Table S2. Complete forward-fold development results

Complete configuration-by-fold development evidence is retained, with a selected-configuration overview followed by all model/configuration sections. Each fold fits preprocessing on earlier years and evaluates the next year. AP is average precision. These training-only metrics are not independent final-test evidence: the same development

history supports selection and out-of-fold construction, rather than nested independent evaluation. All rows and section breaks are retained; the table is not forced into a one-page image.

S.B Complete prediction and calibration evidence

Table S3. Complete prediction and calibration evidence

Complete probability-quality and discrimination evidence is reported separately for 2020 validation (45,364 mortgages; 771 events) and 2023 test (49,338 mortgages; 886 events). The outcome is 90+ day delinquency during the first 24 scheduled-payment months in purchased/eligible mortgages. Raw ROC AUC and AP (average precision) are the basis for discrimination comparisons; calibrated ranking measures are archived but can be affected by isotonic-induced ties. Historical mappings are applied unchanged. ECE uses ten fixed equal-width bins, last including one; intercept and slope are jointly estimated from probabilities clipped at 10^{-6} before the logit. FT-Transformer is explicitly exploratory/appendix-only. Years provide temporal-transport evidence, not IID comparisons.

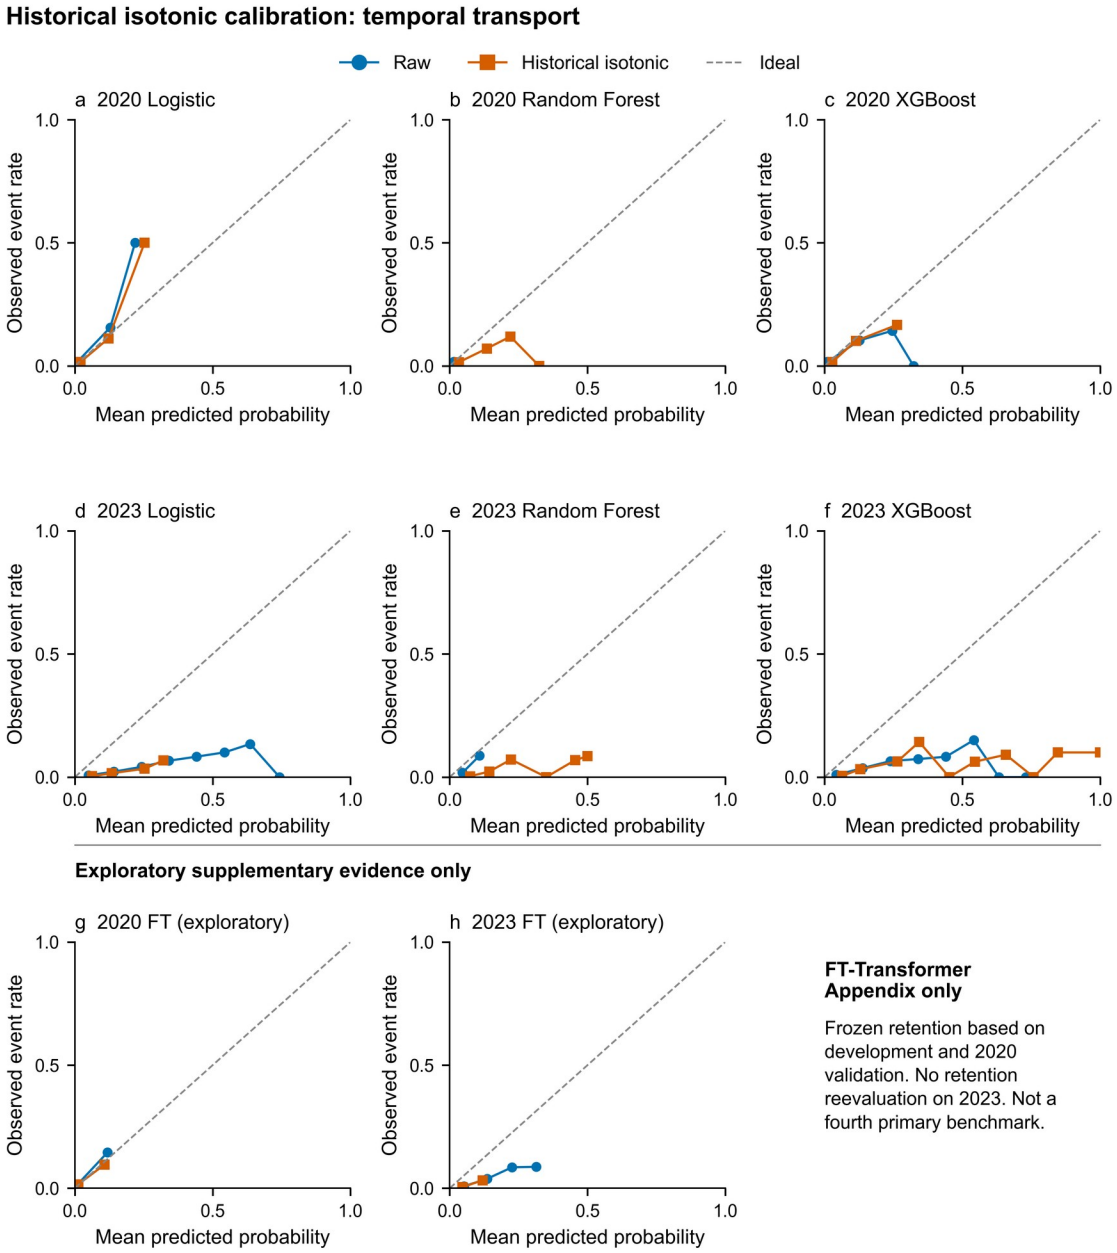
Figure S1. Expanded calibration evidence across evaluation periods.

Full-range reliability diagrams compare raw and historically calibrated probabilities for 90+ day delinquency during the first 24 scheduled-payment months in the 2020 validation and 2023 purchased/eligible cohorts. The three primary models and separately labelled exploratory FT-Transformer evidence use the same ten equal-width bins, with the last including one. Empty bins are omitted and occupied-bin points are connected without smoothing. The diagonal indicates ideal reliability. Any labelled inset crops both axes to 0–0.20 and is accompanied by full-range context and an outside-inset count; cropping does not improve calibration. Historical isotonic mappings are applied unchanged. These periods assess temporal transport, not IID generalization, and FT-Transformer's appendix-only status is unchanged.



Outcome: 90+ day delinquency during the first 24 scheduled-payment months, among purchased/eligible mortgages. 2020 validation N = 45,364 (771 events); 2023 test N = 49,338 (886 events). Points use the same ten fixed equal-width bins; empty bins are omitted. Lines connect occupied bins in order without smoothing or refitting. All panels retain the full [0,1] probability range, including extreme points. The historical mapping improved Logistic probability quality in 2020 but worsened Brier and log loss for all three primary models in 2023. This is temporal transport, not a general claim about isotonic calibration.

S.C Decision sensitivities

Table S4. Common calibrated thresholds and illustrative loss

Common calibrated thresholds are 1/2, 1/3, 1/6 and 1/11 for illustrative FN:FP ratios 1:1, 2:1, 5:1 and 10:1. The primary rule remains 5:1. Classification counts, recall, precision and FP + kFN loss use the same purchased/eligible 2023 cohort and the ratio-specific all-non-risky benchmark. The outcome is 90+ day delinquency during the first 24 scheduled-payment months. Undefined precision remains NA. Exploratory FT-Transformer rows are separate and do not enter the primary three-model comparison. No rule is optimized on 2023; illustrative loss is not measured lender economics.

10:1	FT-Transformer	1	10	24230	0.4911021930357939	8860	2.734762979683973

The FN:FP ratios are illustrative: 5:1 remains primary; 1:1, 2:1 and 10:1 are secondary sensitivity analyses. Frozen calibrated common thresholds are 1/2, 1/3, 1/6 and 1/11, respectively. These are analytical classifications as risky/non-risky, not approval decisions. The loss is not measured lender economics. Cost = FP + k × FN; the all-non-risky benchmark costs k × 886 events. Relative cost divides model cost by that benchmark. Benchmark threshold is not applicable; undefined precision remains NA. FT-Transformer is exploratory appendix evidence only. The cohort contains 49,338 purchased/eligible mortgages; outcome: 90+ day delinquency during the first 24 scheduled-payment months.

Table S5. Threshold and probability-regime robustness

Decision evidence distinguishes calibrated common thresholds, raw-probability common thresholds and 2020 validation-optimal thresholds applied unchanged to 2023. The latter two are secondary sensitivities, not the primary rule or test-optimal choices. Counts concern analytical risky/non-risky classifications in the purchased/eligible 2023 cohort for 90+ day delinquency during the first 24 scheduled-payment months. Loss is FP + kFN under the stated illustrative ratio; each comparison uses its matching all-non-risky benchmark. Undefined quantities remain NA.

All three frozen regimes are shown for illustrative FN:FP ratios 1:1, 2:1, 5:1 and 10:1. Calibrated common 5:1 remains the primary rule. The 2020-optimal thresholds were selected on validation and transported unchanged to 2023; they are robustness evidence, not primary, test-optimal or economically optimal thresholds. No threshold was

selected on 2023. Comparisons remain descriptive point estimates. Cost = FP + k × FN; relative cost is versus the ratio-specific all-non-risky benchmark. Classified as risky/non-risky does not denote approval decisions; illustrative loss is not measured lender economics. Undefined precision remains NA. Thresholds are rounded for display only: some saved Logistic and XGBoost 2020 thresholds differ only at floating-point precision but yield distinct classifications. Full-precision thresholds, confusion cells and rates remain in the accompanying tables. Artwork displays every ratio/model/regime in compact form.

S.D Complete RQ3 profiles and adjusted associations

Table S6. Complete numeric profiles of model-induced reclassification

All four joint classification cells are profiled for the seven numeric origination predictors. Direction 1 is Logistic classified as non-risky/XGBoost classified as risky; direction 0 is the reverse. The calibrated common illustrative 5:1 threshold is 1/6. The disagreement sample contains 5,950 mortgages (1,670 and 4,280 by direction). Observed and missing counts are separate; descriptive means use observed values, not zero imputation. Signed SMDs are direction 1 minus direction 0. Observed delinquency rates are descriptive only; the association outcome is disagreement direction. Adjusted ORs use separate full-cohort standard-deviation scaling.

Table S7. Complete categorical profiles of model-induced reclassification

Complete categorical profiles and directional percentage-point contrasts retain every recorded category, including unknown/unavailable categories and detailed geography. Direction 1 is Logistic classified as non-risky/XGBoost classified as risky; direction 0 is the reverse, under calibrated probabilities and the common illustrative 5:1 threshold of 1/6. Differences are direction 1 minus direction 0. Cells below 100 mortgages in either disagreement direction are suppressed from interpretation, not deleted or newly pooled. Geography is descriptive only and excluded from the adjusted model. All rows and feature/group section breaks are retained.

First time homebuyer

Table S8. Complete adjusted associations with disagreement direction

Complete adjusted associations retain all 27 terms, including the intercept and missingness indicators, and all reference categories and full-cohort numeric scales. The outcome is disagreement direction among 5,950 mortgages, not delinquency: OR > 1 is associated with Logistic non-risky/XGBoost risky and OR < 1 with the reverse. Ordinary maximum-likelihood estimation failed the Classic FICO missingness-indicator estimability guard; the identical-design Firth fallback was used. Eleven sparse terms remain in the fitted design but are suppressed from substantive interpretation. Intervals are approximate expected-information Wald 95% intervals, not profile-likelihood intervals. Extreme ORs and wide intervals are retained untruncated. Section S.F reports the approved stopping rule and numerical diagnostics.

Optional Figure S2

Figure S2, a directional-odds-ratio forest plot, is optional, not generated and not required. No Figure S2 asset is inserted or claimed as present; complete adjusted estimates remain in Table S8.

S.E Robustness definitions and full evidence

Table S9. Robustness cohort flows

Annual cohort flows preserve all seven sensitivity definitions and role-specific maturity restrictions. Event rate is events divided by eligible mortgages; exclusion rate uses the calendar-and-quarter eligible pool, not gross annual mortgages. Annual source reproduction ends in March 2026, while role-specific maturity cutoffs are applied separately; Section S.G explains the implementation correction without changing a scientific rule. R6 restricts test to 2023Q2–Q4. R2 changes the outcome to distress composite; R3 changes the remaining-on-book population and estimand; R7 adds a First Payment Date timing proxy. These are purchased/eligible mortgage cohorts, not the whole mortgage market. All annual rows and specification sections are retained.

R1

Candidate C: observed 03–99 event requires complete valid history through that event; Candidate A complete-path negatives remain.

Saved change description: Three time-feature sensitivity

Table S10. Full robustness matrix

Complete R1–R7 evidence includes role counts, selected settings, all configuration-by-fold results, raw/calibrated validation and test metrics, calibration diagnostics, four illustrative loss ratios, three decision regimes, matching benchmarks and calibrated common-5:1 Logistic–XGBoost classification cells. No model/configuration or regime is averaged away. Each sensitivity's 2020-optimal thresholds are applied unchanged, not replaced with the primary analysis's thresholds or optimized on test. Empty/inapplicable fields and undefined quantities are distinguished from zero. R2 changes the outcome, R3 changes the estimand, and R7 adds the First Payment Date timing proxy with out-of-support extrapolation. The archival sections retain all rows; no FT-Transformer or directional-association sensitivity fit is included.

R1

Candidate C: observed 03–99 event requires complete valid history through that event; Candidate A complete-path negatives remain.

Role Count (3 records)

role	role_event_rate	role_n	role_positive_n

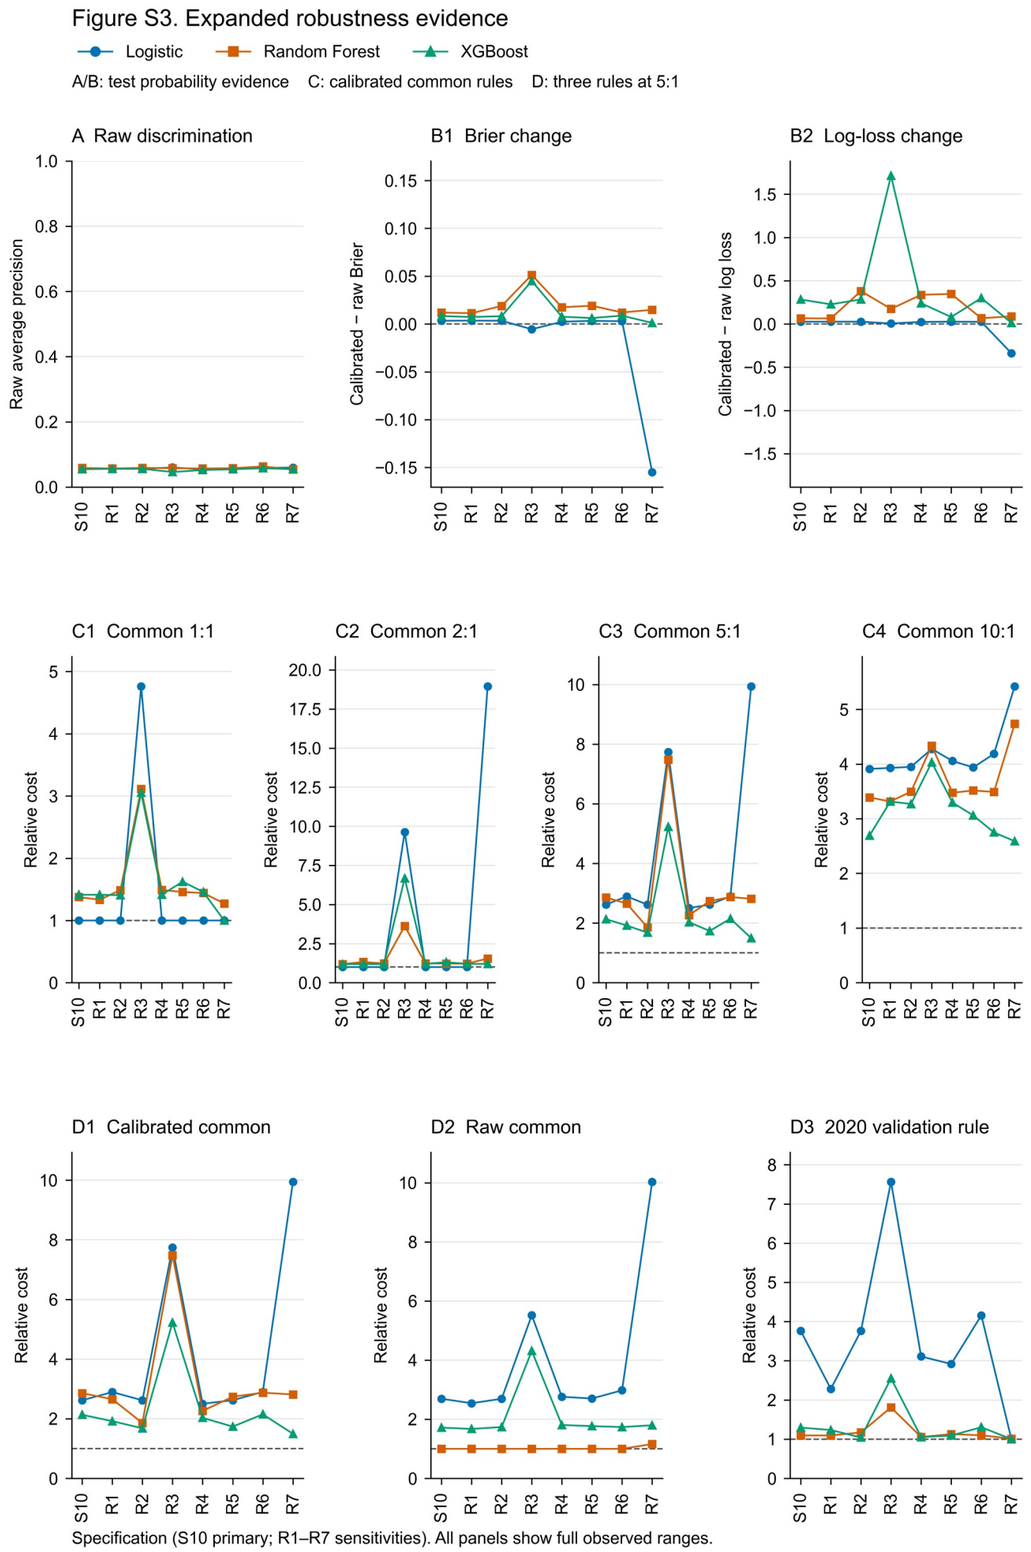
Figure S3. Expanded discrimination, calibration and decision sensitivities.

The primary analysis and R1–R7 are compared in their own purchased/eligible cohorts using the three primary models. Panels report raw average precision (AP), calibrated-minus-raw Brier/log-loss changes, costs under the four common calibrated illustrative loss ratios, and common-5:1 raw-probability/unchanged 2020-validation-optimal sensitivities alongside the calibrated-common reference. AP is average precision, not trapezoidal precision–recall area. Positive probability-loss changes indicate worsening; costs use each specification's own ratio-specific all-non-risky benchmark. R2 changes the 90+ day delinquency during the first 24 scheduled-payment months outcome to distress composite; R3 conditions on remaining on book and changes the estimand; R7 uses First Payment Date as a timing proxy with out-of-support extrapolation. R7 Logistic's probability-quality improvement remains visible, so the evidence is not a blanket claim that calibration worsens. Secondary rules do not replace the primary illustrative calibrated 5:1 rule. Loss is not measured lender economics; different panel ranges are labelled and no uncertainty bands are shown.



S.F Numerical estimation and provenance

The final directional association analysis retained the frozen 5,950 disagreement loans and the identical design: 27 terms, including the intercept and the Classic FICO missingness indicator. Ordinary maximum-likelihood logistic regression was attempted first. Its frozen estimability guard failed because the Classic FICO missingness indicator produced an extreme coefficient (absolute magnitude approximately 21.44). The identical covariates, references, outcome and sample were then estimated using the approved Firth bias-reduced logistic fallback. No numerical preconditioning was adopted. Firth was not selected for preferred coefficient signs or substantive results.

The accepted Firth fit converged after 47 iterations under the approved plateau stopping amendment. The final adjusted-score infinity norm was approximately 1.76×10^{-7}, the proposed Newton-step infinity norm approximately 1.83×10^{-7}, and the consecutive plateau streak five. This amendment requires both norms to be at most 10^{-6}; at least five consecutive iterations with absolute penalized-log-likelihood change at most 10^{-10} and accepted parameter-change infinity norm at most 10^{-12}; a minimum of 20 iterations; and all existing finite-value, positive-definite information, covariance, coefficient and identification guards. The original strict-step stopping criterion remains an alternative; failure of both criteria fails closed. The final expected-information condition number was approximately 3,454. This was an approved numerical stopping amendment, not a change to the Firth objective, adjusted score, scientific design or interpretation rules, and it preceded acceptance of the association estimates.

Table S8 preserves the complete term archive and reference/scaling information. Its 95% confidence intervals are approximate Wald intervals based on expected information, not profile-likelihood intervals. Eleven sparse terms remain in the fitted design but are suppressed from substantive interpretation under the frozen fewer-than-100 subgroup-direction rule. Associations describe characteristics associated with disagreement direction between mortgages classified as risky/non-risky; they are not delinquency effects or causal estimates.

The final PASS manifest and its approved protocol hash govern this completed analysis. Earlier diagnostic wording stating that the RQ3 result directory was absent described an earlier stage and is superseded by the authoritative completed manifest. Source, protocol and output hashes are recorded in the accompanying display provenance; this supplementary note reports saved diagnostics only and performs no new estimation.

S.G Step 12 source-reproduction implementation correction

Before accepted robustness model fitting, an implementation mismatch was found between annual source reproduction and role-specific calendar-maturity eligibility. Step 6 reproduced annual outcomes using the full Release 47 source endpoint through March 2026 and then applied role eligibility separately. The initial Step 12 helper instead used the December 2022 development-role cutoff while attempting to reproduce the earlier annual records. These are distinct operations: a record may have a valid annual-source label under the later endpoint while remaining ineligible for a role whose 24-month window must already have matured.

The mismatch stopped the first R1 attempt during development-cohort construction. The preserved log and correction audit show that this attempt reached no hyperparameter tuning, model fit, calibration, accepted robustness result or 2023 scientific evaluation. The helper was corrected to use the annual March 2026 source endpoint for source reproduction, while all role-specific maturity cutoffs remained unchanged. The corrected pre-run manifest is bound by hash to all seven accepted R1–R7 manifests, documenting that the implementation correction preceded their accepted model fitting. The failed-attempt evidence and stale checkpoints were retained, not deleted. Historical “not started” statements in the correction record describe that earlier stage, not the subsequently completed PASS robustness suite.

This was a source-reproduction versus role-eligibility cutoff correction, not an outcome-rule revision, post-hoc robustness redefinition or scientific specification change. Candidate A/B/C, the predictor set, temporal splits, calibration, decision rules, RQ3 rules and the scientific robustness protocol were unchanged. The primary development counts remained 239,435 loans / 4,550 events for training and 45,364 / 771 for validation; Step 10 and Step 11 remained untouched.

Table S9 records the role-specific flows and their calendar/quarter-pool denominators. In the 2020 audit, 4,255 loans were calendar-immature for T2 validation; 4,202 nevertheless had valid annual-source labels under the later source endpoint and 53 remained unlabeled. Those later annual labels did not admit these loans to validation. This distinction explains why annual-source reproduction must not substitute for role-specific maturity eligibility. The note summarizes the saved correction audit and preservation hashes only; no cohort is reconstructed here.
